

What is Dogie®?

Dogie® is the security module contained within cityNEX® and the letters D-O-G-I-E are short for **D**igital **O**bservation **G**athering of **I**mages for **E**valuation and/or **E**vidence.

Dogie® provides streaming vision transmissions from both city and private security cameras, to and from the suburbs and your local Police Station.

How Dogie® works

Imagine being able to install a home or office security system that not only activates an alarm but also sends a live video of the event directly to you, or your chosen responder. (Your responder could be City Security, a security company, Police, Fire or Emergency services.)

Well, STOP imagining, that is exactly what DOGIE® does!!!

Key features of Dogie® include:

- Collecting video images for transmission from home and business surveillance cameras and then sending them directly to your chosen responder.
- Diverting images from your first responder directly to the Police, Fire or Emergency services.
- Allowing you to place wireless Dogie® compliant cameras anywhere in your home or office, which are able to transmit vision by radio to anywhere, including your car.

* Dogie® is available as a D.I.Y. kit or professionally installed for you

Shown left is an example of a D.I.Y. kit which will be available from selected retailers.

What does Dogie® offer?

A useable and demonstrable home and office security system that has a real chance of preventing and/or reducing crime.

It is a fact that 98% of all home and office alarms are false alarms, as a result, police ignore the bulk of home and business alarms except for identified crises - police simply do not have the manpower to do more - this means that reaction times are slow and most alarms are left unattended.

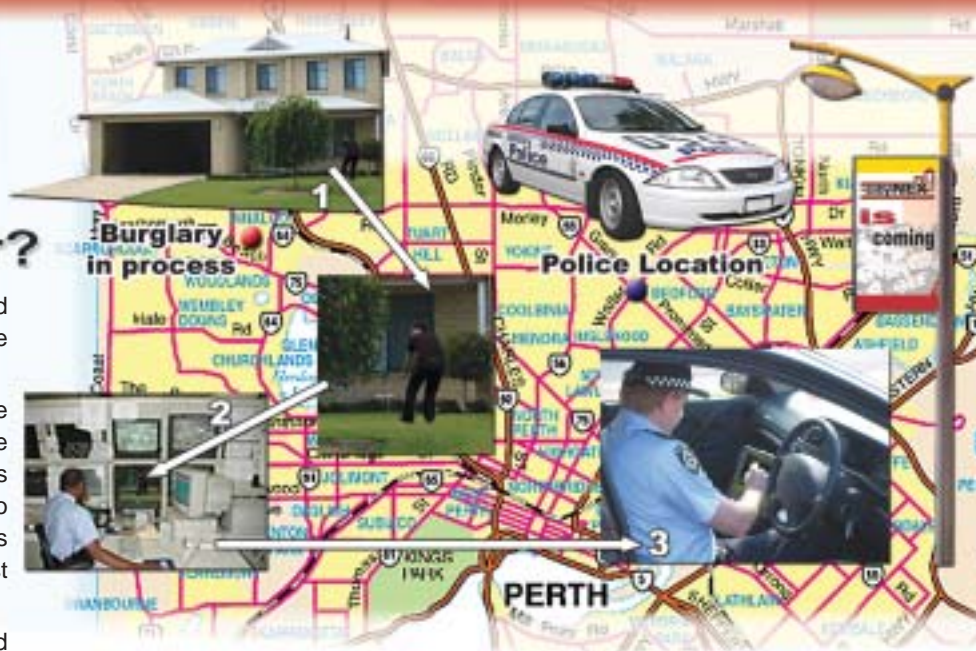

Dogie® moves your alarm signal to the head of the queue and gives you a better chance of grabbing attention!

How?

When your alarm is activated, it directly transmits live streaming vision to a real person who is then able to see the crime in real time and pass vision on to police in real time. In this manner, the crisis is identified and police DO react to an identified crisis!

**For further details on how the system works, please enter our website: www.citynex.com
Go to Surveillance Nexus then choose either Business Security or Home Security module from the menu**

Shown in the diagram above is an example of how the Police utilise Dogie®.

1. When an alarm is triggered, Dogie® transmits live streaming vision to a monitoring centre of your choice*. Vision will only be transmitted once the alarm has been triggered, this is to maintain privacy
2. Your chosen monitoring centre (or responder) can see and record events unfolding, the responder can hand over vision control to police at any time.
3. Passed on to police and being a bi directional system, the technology is in place for them to take full control of the cameras from any remote position.

Police monitor the situation and decide what course of action to take. This could range from an immediate and direct response, to no more than recording evidence for actioning at a later stage.

*A cityNEX® wireless system must be installed. Dogie® is a joint TMI, police and city initiative
